

ABSTRACT OF THE DISCLOSURE

A portable stand alone treatment station for eyes which have been exposed to corrosive liquids, noxious gases and foreign objects. An eye washing fluid reservoir and one or more applicators are mounted on a two-wheel cart. The eye washing fluid in the reservoir is stored under pressure to discharge the eye washing fluid from the applicator when a resiliently biased valve is opened. The tank is pressurized by a hand pump mounted in the tank or through a valve in a wall of the tank. The portability of the station allows it to be relocated on an as needed basis or to be transported to an injured person and carried in a vehicle.
